

PSYC305L: Reflection Paper 2

This paper will be designed to help you with Lab 2 – the introduction section for the visual search experiment. To write an introduction section, we often look at literature reviews of previously published articles to get the information we need.

For reflection paper 2, find three papers that give the background necessary to write an introduction section. The three papers should give the following information:

1. Early perception splits features and sends them to different parts of the brain.
2. What attention is.
3. Feature integration theory (Treisman, 1980)

One of the three papers I have already given to you (3), and I recommend reading it to find at least one of the other two papers. Once found, briefly summarize the paper and write a few sentences about why it will help support your hypothesis. Include an APA citation for all three papers. Once done, it will be much easier to write your Lab 2, so I recommend doing this first.
