

Quiz 10?

1. A difference in P1 ERP amplitude between the attended and unattended visual fields is evidence for what?
 - a. **Early selection**
 - b. Late selection
 - c. Reflexive attention
 - d. Voluntary attention
2. Why is the Stroop task evidence for late selection?
 - a. The semantic processing of the word occurs in V4 so it interferes with color attention
 - b. **The semantic word interferes with attention when attending to the ink color suggesting attention occurs after perception is complete.**
 - c. When attending to the word, the color interferes with attention decreasing RT in the incompatible trials
3. RT stays the same in _____ while RT increases in _____ as the number of distractors increases.
 - a. **Feature search, conjunction search**
 - b. Conjunction search, feature search
 - c. Early selection, late selection
 - d. Late selection, early selection
4. The primary symptom of spatial neglect is
 - a. a deficit in voluntary attention to the ipsilesional visual field
 - b. a deficit in voluntary attention to the contralesional visual field
 - c. a deficit in reflexive attention to the ipsilesional visual field
 - d. **a deficit in reflexive attention to the contralesional visual field**
